About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished
Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or ECNORM. Click to view need further assistance, please contact the Customer Service Centre: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch

Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 300 terminological entries in English and French, with equivalent terms in 19 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "tEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights.

IEC 62873-3-3 has been prepared by subcommittee 23E: Circuit breakers and similar equipment for household use, of IEC technical committee 23: Electrical accessories. It is an International Standard.

This second edition cancels and replaces the first edition published in 2016. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) Modification of scope to address other devices in addition to RCDs;
- b) Modification of Clause 8 so that IEC 62873-3-3 can be referred to by other product standards in addition to those for RCDs;

c) Modification of 9.1 so that IEC 62873-3-3 can be referred to by other product standards in addition to those for RCDs.

The text of this International Standard is based on the following documents:

Draft	Report on voting
23E/1274/FDIS	23E/1306/RVD

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

A list of all parts of the IEC 62873 series published under the general title Residual current operated circuit-breakers for household and similar use can be found on the IEC website.

The following differing practices of a less permanent nature exist in the countries indicated below:

- NOTE 2 of Clause 1: the use of aluminium screw-type terminals for use with copper conductors is not allowed (Austria, Australia and Germany).
- NOTE 2 of Clause 1: terminals for aluminium conductors only are not allowed (Austria and Germany);
- NOTE 2 of Clause 1: the use of aluminium conductors is not allowed for final circuits in household and similar installations e.g. offices, shops (Spain);
- NOTE 2 of Clause 1: the minimum cross-sectional area for aluminium conductors is 16 mm² (Denmark).

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/standardsdev/publications.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- · reconfirmed,
- withdrawn
- replaced by a revised edition, or
- amended.

INTRODUCTION

This document is part of the IEC 62873 series described in the outline document IEC 62873-1.

RESIDUAL CURRENT OPERATED CIRCUIT-BREAKERS FOR HOUSEHOLD AND SIMILAR USE –

Part 3-3: Specific requirements for devices with screw-type terminals for external untreated aluminium conductors and with aluminium screw-type terminals for use with copper or with aluminium conductors

1 Scope

This part of IEC 62873 applies to devices equipped with screw-type terminals of copper – or of alloys containing at least 58 % of copper (if worked cold) or at least 50 % of copper (if worked otherwise), or of other metal or suitably coated metal, no less resistant to corresion than copper and having mechanical properties no less suitable – for use with untreated aluminium conductors, or with screw-type terminals of aluminium material for use with copper or aluminium conductors.

This document does not cover the use of aluminium conductors of aluminium terminals for DC applications.

Flexible aluminium conductors are not covered by this document.

NOTE 1 Flexible aluminium conductors are under consideration

This document cannot be used alone but it is intended to be applied together with the applicable product standard.

In this document, copper-clad and nickel-clad aluminium conductors are considered as aluminium conductors.

NOTE 2 In AT, AU and DE, the use of auminium screw-type terminals for use with copper conductors is not allowed.

- In AT and DE, terminals for aluminium conductors only are not allowed;
- In ES, the use of aluminium conductors is not allowed for final circuits in household and similar installations e.g. offices, shops;
- In DK, the minimum cross-sectional area for aluminium conductors is 16 mm².

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 62873-2, Residual current operated circuit-breakers for household and similar use – Part 2: Residual current devices (RCDs) – Vocabulary

3 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 62873-2 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp
- IEC Electropedia: available at http://www.electropedia.org/

3.1

treated conductor

contact area of a conductor that has had its oxide layer on the outside strands scraped away and/or has had a compound added to improve connectability and/or prevent corrosion

3.2

untreated conductor unprepared conductor

conductor which has been cut and the insulation of which has been removed for insertion into a terminal

Note 1 to entry: A conductor, the shape of which is arranged for introduction into a terminal or the strands of which are twisted to consolidate the end, is considered to be an unprepared conductor.

[SOURCE: IEC 60050-442:1998, 442-01-26]

3.3

equalizer

arrangement used in the test loop to ensure an equipotentiality point and uniform current density in a stranded conductor, without adversely affecting the temperature of the conductor(s)

3.4

reference conductor

continuous length of the same type and size conductor as that used in the terminal unit under test and connected in the same series circuit, which enables the reference temperature and, if required, reference resistance to be determined

3.5

stability factor

Sf

measure of temperature stability of a terminal unit during the current cycling test

4 Classification

Clause 4 of the product standard applies.

5 Characteristics of devices

Clause 5 of the product standard applies.

6 Marking and other product information

In addition to Clause 6 of the product standard, the following requirements apply.

The terminal marking defined in Table 1 shall be marked on the product, near the terminals.

The other information concerning the number of conductors, the screw torque values (if different from the product standard) the type of conductor (solid or stranded) and the cross-sections shall be indicated on the product.

Al/Cu

Conductor types accepted Marking

Copper only None

Aluminium only Al

Table 1 - Marking for terminals

The manufacturer shall state in his catalogue that, for the clamping of an aluminium conductor, the tightening torque shall be applied with appropriate means.

7 Standard conditions for operation in service and for installation

Clause 7 of the product standard applies.

8 Requirements for construction and operation

Aluminium and copper

The requirements of Clause 8 of this document apply in addition to Clause 8 of the product standard.

For the connection of aluminium conductors, products shall be provided with screw-type terminals allowing the connection of conductors having nominal cross-sections as shown in Table 2.

Terminals for the connection of aluminium conductors and terminals of aluminium for the connection of copper or aluminium conductors shall have mechanical strength adequate to withstand the tests of reliability of screws, current-carrying parts and connections of the product standard, with the test conductors tightened with the torque indicated in Table 12 of this document, or with the torque specified by the manufacturer, which shall not be lower than that specified in Table 12 of this document.

Table 2 – Connectable cross-sections of aluminium conductors for screw-type terminals

Rated current ^a	Range of nominal cross-sections ^b to be clamped mm ²
Up to and including 25	10
Above 25 up to and including 32	10 to 16
Above 32 up to and including 50	10 to 25
Above 50 up to and including 80	10 to 35
Above 80 up to and including 100	16 to 50
Above 100 up to and including 125	25 to 70

It is required that, for current ratings up to and including 50 A, terminals be designed to clamp solid conductors as well as rigid stranded conductors.

Compliance is checked by inspection, by measurement and by fitting in turn one conductor of the smallest and one of the largest cross-section areas as specified.

Terminals shall allow the conductors to be connected without special preparation. This requirement applies for any rating of the terminal, whatever is stated in the product standard.

b Maximum wire sizes of product standard, increased according to Table D.2 of IEC 61545:1996.

Compliance is checked by inspection and the tests of Clause 9.

9 Tests

9.1 General

Clause 9 of the product standard applies, with the following modifications/additions:

For the tests which are influenced by the material of the terminal and the type of conductor that can be connected, the test conditions of Table 3 are applied.

Additionally, the test of 9.3 is carried out on terminals separated from the product.

Table 3 - List of tests according to the material of conductors and terminals

Material of terminals	Copper or copper alloy ^a	Alumin	iuma
Material of conductor (Table 1)	Al Use Table 2 and Table 5 of this document	Cu Use Table 10 and Table 11 of this document	Al Use Table 2 and Table 5 of this document

70,0		12,0	50	12	00	9,266	10,64			

NOTE Diameters of the largest rigid and flexible conductors are based on Table 1 of IEC 60228, Table 1 and, for AWG conductors, on ASTM B 172-17.

9.2 Test conditions

The test conditions of the product standard apply, except that the Al conductors to be connected are taken from Table 5.

Table 5 – Cross-sections (S) of aluminium test conductors corresponding to the rated currents

s	I _n
mm ²	A
10	<i>I</i> _n ≤ 32
16	32 < I _n ≤ 50
25	50 < I _n ≤ 63
35	63 < I _n ≤ 80
50	80 < I _n ≤ 100
70	100 < I _n ≤ 125

a Nominal diameter + 5 %.

b Largest diameter + 5 % for any of the three classes I, K, M.

Dimensions for class 5 flexible conductors only, according to IEC 60228.

9.3 Current cycling test

9.3.1 General

This test verifies the stability of the screw-type terminal by comparing the temperature performance with that of the maximum allowed temperature for its product standard under accelerated cycling conditions.

This test is carried out on separate terminals.

9.3.2 Preparation

The test is performed on four specimens, each one made by a couple of terminals, assembled in a manner which represents the use of the terminals in the product (see examples shown in Figure 2 to Figure 6). The screw-type terminals which have been removed from the product shall be attached to the conducting parts of the same cross-section, shape, metal and finish as that on which they are mounted on the product. The screw-type terminals shall be fixed to the conducting parts in the same manner (position, torque, etc.) as on the product. If one specimen fails during the test, four other specimens shall be tested and no other failures are admitted.

9.3.3 Test arrangement

The general arrangement of the samples shall be as shown in Figure 1.

90 % of the value of torque stated by the manufacturer or, if not stated, selected in Table 12 shall be used for the test specimens.

For a range of devices of different current ratings having identical design, the test is carried out with conductors according to Table 5 or Table 11, as applicable, corresponding to its maximum current rating. The length of the test conductor from the point of entry to the screw-type terminal specimens to the equalizer (see 3.3) shall be as in Table 6.

Table Test conductor length

Conductor cross-section	Conductor wire size	Minimum conductor length
mm ²	AWG	mm
S ≤ 10,0	≤ 8	200
16,0 ≤ S ≤ 25,0	6 to 3	300
35,0 ≤ <i>S</i> ≤ 70,0	2 to 00	460

Test conductors are connected in series with a reference conductor of the same cross-section.

The length of the reference conductor shall be approximately at least twice the length of the test conductor.

Each free end of the test and reference conductor(s) not connected to a screw-type terminal specimen shall be welded or brazed to a short length of an equalizer of the same material as the conductor and of cross-section not greater than that given in Table 7. All strands of the conductor shall be welded or brazed to make an electrical connection with the equalizer.

Tool-applied compression type terminations without welding may be used for the equalizer if acceptable to the manufacturer and if the same performance is provided.

Barrier of the standard and	Maximum cross-section					
Range of test current	mm^2					
Α	Al Cu					
0 to 50	45	45				
51 to 125	105	85				
126 to 225	185	155				

Table 7 - Equalizer and busbar dimensions

The separation between the test and reference conductors shall be at least 150 mm.

The test specimen shall be suspended either horizontally or vertically in free air by supporting the equalizer or busbar by non-conductive supports so as not to subject the screw-type terminal to a tensile load. Thermal barriers shall be installed midway between the conductors and shall extend $25 \text{ mm} \pm 5 \text{ mm}$ widthways and $150 \text{ mm} \pm 10 \text{ mm}$ lengthways beyond the screw-type terminals (see Figure 1). Thermal barriers are not required provided the specimens are separated by at least 450 mm. The specimens shall be located at least 600 mm from the floor, wall or ceiling.

The test specimens shall be located in a substantially vibration-free and draught-free environment and at an ambient temperature between 15 °C and 35 °C. Once the test is started, the maximum permissible variation is ±1 K provided the range limitation is not exceeded.

9.3.4 Temperature measurement

Temperature measurements are made by means of thermocouples, using a wire having a cross-section of not more than 0,07 mm² (approximately 30 AWG).

For screw-type terminals, the thermocouple shall be located on the conductor entry side of the screw-type terminal, close to the contact interface.

For the reference conductor, the thermocouples shall be located midway between the ends of the conductor, and under its insulation.

Positioning of the thermocouples shall not damage the screw-type terminal or the reference conductor.

NOTE 1 Drilling of a small hole and subsequent fastening of the thermocouple is an acceptable method, provided that the performance is not affected and that it is agreed by the manufacturer.

The ambient air temperature shall be measured with two thermocouples in such a manner as to achieve an average and stable reading in the vicinity of the test loop without undue external influence. The thermocouples shall be located in a horizontal plane intersecting the specimens, at a minimum distance of 600 mm from them.

NOTE 2 A satisfactory method for achieving a stable measurement is, for example, to attach the thermocouple to unplated copper plates approximately 50 mm × 50 mm, having a thickness between 6 mm and 10 mm.

9.3.5 Test method and acceptance criteria

NOTE 1 Evaluation of performance is based on both the limit of screw-type terminal temperature rise and the temperature variation during the test.

The test loop shall be subjected to 500 cycles of 1 h current-on and 1 h current-off, starting at an alternating current equal to 1,12 times the test current value determined in Table 8. Near the end of each current-on period of the first 24 cycles, the current shall subsequently be adjusted to raise the temperature of each terminal to a minimum of t °C. Nevertheless the reference conductor temperature shall not be lower than 75 °C.

t °C = maximum temperature rise allowed by the relevant product standard + 35 °C.

EXAMPLE For IEC 61008-1, t °C = 65K + 35 °C = 100 °C

At the 25th cycle, the test current shall be adjusted for the last time and the stable temperature shall be recorded as the first measurement. There shall be no further adjustment of the test current for the remainder of the test.

Temperatures shall be recorded for at least one cycle of each working day, and after approximately 25, 50, 75, 100, 125, 175, 225, 275, 350, 425, and 500 cycles.

The temperature shall be measured during the last 5 min of the current-on time. If the size of the set of test specimens or the speed of the data acquisition system is such that not all measurements can be completed within 5 min, the current-on time shall be extended as necessary to complete such measurements.

After the first 25 cycles, the current-off time may be reduced to a time 5 min longer than the time necessary for all terminal assemblies to cool down to a temperature between ambient temperature $T_{\rm a}$ and $T_{\rm a}$ + 5 K during the current-off period. Forced-air cooling may be employed to reduce the off time, if acceptable to the manufacturer. In that case, it shall be applied to the entire test loop and the resulting temperature of the forced air shall not be lower than the ambient air temperature.

The stability factor Sf for each of the 11 temperature measurements is to be determined by subtracting the average temperature deviation D from the 11 values of the temperature deviation d.

The temperature deviation d for the 11 individual temperature measurements is obtained by subtracting the associated reference conductor temperature from the screw-type terminal temperature.

NOTE 2 The value of d is positive if the screwtype temperature is higher than that of the reference conductor and negative if it is lower.

For each screw-type terminal:

- the temperature rise shall not exceed 110 K;
- the stability factor stable half not exceed ±10 K.

An example of calculation for one screw-type terminal is given in Table 9.

Table 8 - Test current as a function of rated current

	Metric sizes								
Data d accument	A	AI .	Data da assessat	Cu					
Rated current A	size Test Current A		Rated current A	size mm ²	Test Current A				
-	-	-	0 < I _n ≤ 6	1	18.5				
-	-	-	6 < I _n ≤ 13	1,5	22				
-			13 < I _n ≤ 20	2,5	30				
-	-	-	20 < I _n ≤ 25	4	40				
$0 < I_{n} \le 32$	10	60	25 < I _n ≤ 32	6	54				
$32 < I_{\rm n} \le 50$	16	79	32 < I _n ≤ 50	10	5 75				
50 < I _n ≤ 65	25	99	50 < I _n ≤ 63	16,75	100				
65 < I _n ≤ 80	35	137	63 < I _n ≤ 80	25	130				
80 < I _n ≤ 100	50	171	80 < I _n ≤ 100	35	183				
100 < I _n ≤ 125	70	190	100 < I _n ≤ 125	50	228				

Table 9 – Example of calculation for determining the average temperature deviation D

		Tempe	ratures	Temperature	Stability	
Temperature measurement	Cycle number	Screw-type terminal <i>a</i>	Reference conductor b	$deviation \\ d = a - b$	factor Sf = d - D	
		°C 4	°C	К	K	
1	25	79	78	1	0,18	
2	50	80	77	3	2,18	
3	75	78	78	0	-0,82	
4	100	76	77	-1	-1,82	
5	125	77	77	0	-0,82	
6	175	78	77	1	0,18	
7	225	79	76	3	2,18	
8	275	78	76	2	1,18	
9	350	77	78	-1	-1,82	
10	425	77	79	-2	-2,82	
11	500	81	78	3	2,18	

Average temperature deviation $D = \frac{\sum d}{n} = \frac{9}{11} = 0.82$, where n is the number of measurements.

Table 10 - Connectable cross-sections of copper conductors for screw-type terminals

	current ^a A	Range of nominal cross-section to be clamped b			
Greater than	Greater than Up to and including		Flexible conductors		
_	13	1 to 2,5	1 to 2,5		
13	16	1 to 4	1 to 4		
16	25	1,5 to 6	1,5 to 6		
25	32	2,5 to 10	2,5 to 6		
32	50	4 to 16	4 to 10		
50	80	10 to 25	10 to 16		
80	80 100		.16 to 25		
100	125	25 to 50	25 to 35		

A range of PCBMs having the same fundamental design and having the same design and construction of terminals, the terminals are fitted with copper conductors of the smallest cross-section for the minimum rated current and largest cross-section for the maximum rated current, as specified, solid and stranded, as applicable.

Table 11 - Test copper conductors corresponding to the rated currents

Rated current In A	<i>I</i> _n ≤ 6	6 < I _n ≤ 13	13 < I _n ≤ 20	20 √n ≤ 25	25 < I _n ≤ 32	32 < I _n ≤ 50	50 < I _n ≤ 63	63 < I _n ≤ 80	80 < I _n ≤ 100	100 < I _n ≤ 125
S mm ²	1	1,5	2/5	4	6	10	16	25	35	50

Table 12 - Screw thread diameters and applied torques

Nominal diameter of thread		Torque Nm		
Greater than	Up to and including	I	II	III
7.0	2,8	0,2	0,4	0,4
2,8	3,0	0,25	0,5	0,5
3,0	3,2	0,3	0,6	0,6
3,2	3,6	0,4	0,8	0,8
3,6	4,1	0,7	1,2	1,2
4,1	4,7	0,8	1,8	1,8
4,7	5,3	0,8	2,0	2,0
5,3	6,0	1,2	2,5	3,0
6,0	8,0	2,5	3,5	6,0
8,0	10,0	_	4,0	10,0

b It is required that, for current ratings up to and including 50 A, terminals be designed to clamp solid conductors as well as rigid stranded conductors. Nevertheless, it is permitted that terminals for conductors having cross-sections from 1 mm² up to 6 mm² be designed to clamp solid conductors only.

c Rigid stranded conductors shall be used for conductors having cross-sections from 1,5 mm² up to 50 mm² and shall be in compliance with Class 2 of IEC 60228, related to stranded conductors for single-core.
