## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at [www.iso.org/patents](http://www.iso.org/patents). ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 4, *Rolling bearings*, Subcommittee SC 4, *Rolling bearings - Vocabulary, boundary dimensions and geometrical product specifications*.

This sixth edition cancels and replaces the fifth edition (ISO 492:2014), which has been technically revised.

The main changes are as follows:

- symbols have been revised and the symbol list amended;
- some revisions have been made to the geometrical product specifications (GPS) system, such as the indication of  $K_{ia}$  and  $K_{ea}$ ;
- revisions have been made to the symbol for width of asymmetric rings and assembled bearing;
- an extension of deviation limits and tolerance values towards larger bore diameter and outside bearing diameters in [Tables 4](#) to [26](#) has been made;
- the tables for the radial bearings and the tapered roller bearings, such as the headings, notes of tables and some other values, have been aligned;
- Annexes A, B, C and D (in ISO 492:2014) have been deleted;
- the stiffness series of tapered roller bearings and background information regarding affected tolerance values have been added in new [Annexes A](#) and [B](#).

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

This document is a machine element geometry standard as defined in the geometrical product specifications (GPS) system presented in matrix model of ISO 14638<sup>[7]</sup>.

The fundamental rules of ISO GPS given in ISO 8015 apply to this document and the default decision rules given in ISO 14253-1<sup>[5]</sup> apply to specifications made in accordance with this document, unless otherwise indicated.

The connection between functional requirements, measuring technique, and measuring uncertainty should always be considered. For measurement uncertainty, ISO 14253-2<sup>[6]</sup> should be considered.

This document uses most of the existing symbols associated with rolling bearings because they are well established in the market. In some cases, new terms are derived from the full GPS definition. The definitions of the established terms and symbols are necessarily changed according to the GPS rules. These changes of terms, definitions and symbols for geometrical product specifications (GPS) to define characteristics and tolerances of rolling bearing components and assemblies are given in ISO 22872 and incorporated in this document.

The representation of symbols, tolerance values, limits of size, deviation limits and limit values derived from GPS indications according to, for example, ISO 1101 and ISO 14405-1, including indications in tables and graphical descriptions, have been revised and implemented in accordance with the principles of ISO 22872.

# Rolling bearings — Radial bearings — Geometrical product specifications (GPS) and tolerance values

## 1 Scope

This document specifies dimensional and geometrical characteristics, deviation limits from nominal sizes, and tolerance values to define the interface (except chamfers) of radial rolling bearings. Nominal boundary dimensions are defined in ISO 15, ISO 355<sup>[2]</sup> and ISO 8443<sup>[4]</sup>.

This document does not apply to certain radial bearings of particular types (e.g. needle roller bearings) or for particular fields of application (e.g. airframe bearings). Tolerances for such bearings are given in the relevant International Standards.

Chamfer dimension limits are given in ISO 582<sup>[3]</sup>.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirement of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 15:2017, *Rolling bearings — Radial bearings — Boundary dimensions, general plan*

ISO 1101:2017, *Geometrical product specifications (GPS) — Geometrical tolerancing — Tolerances of form, orientation, location and run-out*

ISO 5593, *Rolling bearings — Vocabulary*

ISO 8015, *Geometrical product specifications (GPS) — Fundamentals — Concepts, principles and rules*

ISO 14405-1:2016, *Geometrical product specifications (GPS) — Dimensional tolerancing — Part 1: Linear sizes*

ISO/TS 17863:2013, *Geometrical product specification (GPS) — Tolerancing of moveable assemblies*

ISO 22872, *Rolling bearings — Geometrical product specifications (GPS) — Vocabulary and representation of symbols*

## 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 15, ISO 1101, ISO 5593, ISO 14405-1, ISO/TS 17863 and ISO 22872 apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

## 4 Symbols

### 4.1 Symbols for physical quantities

Symbols in [Table 1](#) represent physical quantities in the GPS environment and may sometimes be applied to more than one physical quantity.

In this document, the symbols for tolerance values, deviation limits and limit values are preceded by letter “*t*” in figures and tables.

EXAMPLE 1  $t_{\Delta Bs}$ ,  $t_{Vdmp}$ .

In this document, the symbols for nominal dimensions and values of upper/lower limit of size are not preceded by the letter “*t*” because those values are usually interpreted as nominal dimensions.

EXAMPLE 2  $C$ ,  $D$ .

**Table 1 — Symbols for dimensions and tolerance values**

| Symbol     | Description                                                                                          | Figure                                                                                                                                                                                                                                                                                                                               |
|------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $a$        | Distance from face to define the restricted area for $S_D$ or $S_{D1}$                               | <a href="#">3</a> , <a href="#">8</a> , <a href="#">13</a>                                                                                                                                                                                                                                                                           |
| $B$        | Nominal inner ring width                                                                             | <a href="#">1</a> , <a href="#">2</a> , <a href="#">7</a> , <a href="#">12</a>                                                                                                                                                                                                                                                       |
| $C$        | Nominal outer ring width                                                                             | <a href="#">1</a> , <a href="#">2</a> , <a href="#">7</a> , <a href="#">12</a>                                                                                                                                                                                                                                                       |
| $C_1$      | Nominal outer ring flange width                                                                      | <a href="#">12</a>                                                                                                                                                                                                                                                                                                                   |

## 4.2 Additional symbols

Symbols defined in standards other than ISO 22872 and used in this document are presented in [Table 2](#) for information.

These includes symbols for specification modifiers, complementary specification modifiers and geometrical characteristics.

Table 2 — Additional symbols defined in other standards

| Symbol                                                                                           | Description                  | Figure                                                                                                                                                                                                                                                                  | Reference                      |

## 5 Graphical description

To express that the ISO GPS system in ISO 8015 is applied, the dimensional and geometrical characteristics shall be included in the technical product documentation (e.g. on the drawing). The dimensional and geometrical specifications associated to these characteristics are described in [Figures 1](#) to [17](#).

According to ISO 8015, specifications shall be completed with specification operators, e.g. filtration. These may be agreed between manufacturer and customer case by case.

The indications in [Figures 1](#) to [17](#) illustrate the correlation of interface dimensions and corresponding dimensional and geometrical tolerance symbols. The specifications for single components are illustrated in [Figures 1](#), [2](#), [3](#), [7](#), [8](#), [12](#) and [13](#). The specifications for assembled bearings are illustrated in [Figures 4](#), [5](#), [6](#), [9](#), [10](#), [11](#), [14](#), [15](#), [16](#) and [17](#). The examples are not intended to cover all possible assemblies.

NOTE [Figures 1](#) to [17](#) are drawn schematically and do not necessarily show all design details.

NOTE The symbol “/” (forward slash) shows alternative specification indications depending on tolerance class and diameter series.

Technical drawing of a shaft-hub assembly showing various geometric features and their associated GD&P feature control frames. The drawing includes a shaft with a keyway and a hub with a key. Features are labeled with letters A through K. Feature control frames specify tolerances for position, circular runout, and circular runout. A red watermark 'RDSDISO.COM' is visible across the top left.

Feature Control Frames:

- Feature A:  $\perp \phi t_{SD}$  D
- Feature B:  $\perp \phi t_{SD}$  E
- Feature D:  $\perp \phi t_{SD}$  D
- Feature E:  $\perp \phi t_{SD}$  E
- Feature K:  $\nearrow t_{Sd}$  K

Additional labels:  $(\alpha)$ ,  $(\phi D)$ ,  $\#$ ,  $\parallel$ .

## 6 Deviation limits and tolerance values

### 6.1 General

The deviation limits and tolerance values for cylindrical bores are given in 6.2 and 6.3 and for flanges in 6.4. The deviation limits and tolerance values for tapered bore are given in 6.5.

The diameter series referred to in Tables 4 to 13 are those defined in ISO 15. In Tables 4 to 29, the symbols U and L are used as follows:

- U = upper deviation limit;
- L = lower deviation limit.

The symbol "—" in [Tables 4](#) to [29](#) is used when no values have been established.

The stiffness series referred to in [Tables 14](#), [15](#), [18](#), [19](#), [21](#) and [22](#) are categorized according to [Table 3](#).

Stiffness equivalent factor  $f_S$  is calculated from [Formula \(3\)](#):

$$f_S = (D-d)/d^{0,9} \quad (3)$$

NOTE 1 [Formula \(3\)](#) is similar in concept to ISO 15:2017, A.3.

NOTE 2 [Annex A](#) provides background information on  $t_{VDsp}$  and  $t_{Vdsp}$  for radial tapered roller bearings.

**Table 3 — Tapered roller bearings — Stiffness series**

| $f_S$ |       | Stiffness series | Abbreviation for stiffness series |
|-------|-------|------------------|-----------------------------------|
| >     | ≤     |                  |                                   |
| —     | 0,535 | extra light      | A                                 |
| 0,535 | 0,73  | light            | B                                 |
| 0,73  | 1,3   | medium           | C                                 |
| 1,3   | —     | standard         | S                                 |

#### EXAMPLE 1

Tapered roller bearing 3EC 080 according to ISO 355<sup>[2]</sup> with the boundary dimensions:

$$d = 80 \text{ mm}$$

$$D = 140 \text{ mm}$$

$$f_S = (140-80)/80^{0,9} = 1,16$$

⇒ Values for  $V_{dsp}$  and  $V_{Dsp}$  according to stiffness series C “medium”

#### EXAMPLE 2

Tapered roller bearing 3EC 260 according to ISO 355<sup>[2]</sup> with the boundary dimensions:

$$d = 260 \text{ mm}$$

$$D = 360 \text{ mm}$$

$$f_S = (360-260)/260^{0,9} = 0,67$$

⇒ Values for  $V_{dsp}$  and  $V_{Dsp}$  according to stiffness series B “light”

NOTE 3 Refer to [Annex B](#) for stiffness series for radial tapered roller bearings with boundary dimensions according to ISO 355.

## 6.2 Radial bearings except tapered roller bearings

### 6.2.1 Tolerance class Normal

See [Tables 4](#) and [5](#).

<sup>a</sup> Applies to inner rings and outer rings of single bearings made for paired and stacked assemblies. Also applies to inner rings with tapered bore with  $d \geq 50$  mm.

<sup>b</sup> No values have been established for diameter series 7 and 8.

<sup>c</sup> Applies only to asymmetrical rings.

<sup>d</sup> Applies only to upper deviation limit.

**Table 5 — Radial bearings except tapered roller bearings — Outer ring — Tolerance class Normal**

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in [Table 27](#).<sup>a</sup> Applies before mounting and after removal of internal or external snap ring.<sup>b</sup> Applies to groove ball bearings only.<sup>c</sup> No values have been established for diameter series 7 and 8.<sup>d</sup> Applies only to asymmetrical rings.<sup>e</sup> Applies only to upper deviation limit.**6.2.2 Tolerance class 6**See [Tables 6](#) and [7](#).

**Table 6 — Radial bearings except tapered roller bearings — Inner ring — Tolerance class 6**

<sup>a</sup> Applies to inner rings and outer rings of single bearings made for paired and stacked assemblies. Also applies to inner rings with tapered bore with  $d \geq 50$  mm.

<sup>b</sup> No values have been established for diameter series 7 and 8.

<sup>c</sup> Applies only to asymmetrical rings.

<sup>d</sup> Applies only to upper deviation limit.

**Table 7 — Radial bearings except tapered roller bearings — Outer ring — Tolerance class 6**

Deviation limits and tolerance values in micrometres

NOTE The deviation limits for the outside diameter, D<sub>1</sub>, of an outer ring flange are given in [Table 27](#).

<sup>a</sup> Applies before mounting and after removal of internal or external snap ring.

<sup>b</sup> Applies to groove ball bearings only.

<sup>c</sup> No values have been established for diameter series 7 and 8.

<sup>d</sup> Applies only to asymmetrical rings.

<sup>e</sup> Applies only to upper deviation limit.

**6.2.3 Tolerance class 5**See [Tables 8](#) and [9](#).

**Table 8 — Radial bearings except tapered roller bearings — Inner ring — Tolerance class 5**

<sup>a</sup> Applies to groove ball bearings only.<sup>b</sup> Applies to inner rings and outer rings of single bearings made for paired and stacked assemblies. Also applies to inner rings with tapered bore with  $d \geq 50$  mm.<sup>c</sup> No values have been established for diameter series 7 and 8.<sup>d</sup> Applies only to asymmetrical rings.<sup>e</sup> Applies only to upper deviation limit.

**Table 9 — Radial bearings except tapered roller bearings — Outer ring — Tolerance class 5**

Deviation limits and tolerance values in micrometres

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in [Table 27](#).<sup>a</sup> No values have been established for capped bearings.<sup>b</sup> Applies before mounting and after removal of internal or external snap ring.<sup>c</sup> Does not apply to bearings with flanged outer ring.<sup>d</sup> Applies to groove ball bearings only.<sup>e</sup> No values have been established for diameter series 7 and 8.<sup>f</sup> Applies only to asymmetrical rings.<sup>g</sup> Applies only to upper deviation limit.**6.2.4 Tolerance class 4**See [Tables 10](#) and [11](#).

**Table 10 — Radial bearings except tapered roller bearings — Inner ring — Tolerance class 4**

<sup>a</sup> These deviation limits apply to diameter series 7, 8 and 9 only.

<sup>b</sup> These deviation limits apply to diameter series 0, 1, 2, 3 and 4 only.

<sup>c</sup> Applies to groove ball bearings only.

<sup>d</sup> Applies to inner rings and outer rings of single bearings made for paired or stacked assemblies.

<sup>e</sup> No values have been established for diameter series 7 and 8.

<sup>f</sup> Applies only to asymmetrical rings.

<sup>g</sup> Applies only to upper deviation limit.

**Table 11 — Radial bearings except tapered roller bearings — Outer ring — Tolerance class 4**

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in [Table 27](#).<sup>a</sup> These deviation limits apply to diameter series 7, 8 and 9 only.<sup>b</sup> These deviation limits apply to diameter series 0, 1, 2, 3 and 4 only.<sup>c</sup> No values have been established for capped bearings.<sup>d</sup> Applies before mounting and after removal of internal or external snap ring.<sup>e</sup> Does not apply to bearings with flanged outer ring.<sup>f</sup> Applies to groove ball bearings only.<sup>g</sup> No values have been established for diameter series 7 and 8.<sup>h</sup> Applies only to asymmetrical rings.<sup>i</sup> Applies only to upper deviation limit.

### 6.2.5 Tolerance class 2

See [Tables 12](#) and [13](#).

**Table 12 — Radial bearings except tapered roller bearings — Inner ring — Tolerance class 2**

<sup>a</sup> These deviation limits apply to diameter series 7, 8 and 9 only.<sup>b</sup> These deviation limits apply to diameter series 0, 1, 2, 3 and 4 only.<sup>c</sup> Applies to groove ball bearings only.<sup>d</sup> Applies to inner rings and outer rings of single bearings made for paired or stacked assemblies.<sup>e</sup> Applies only to asymmetrical rings.<sup>f</sup> Applies only to upper deviation limit.

**Table 13 — Radial bearings except tapered roller bearings — Outer ring — Tolerance class 2**

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in [Table 27](#).<sup>a</sup> These deviation limits apply to diameter series 7, 8 and 9 only.<sup>b</sup> These deviation limits apply to diameter series 0, 1, 2, 3 and 4 only.<sup>c</sup> No values have been established for capped bearings.<sup>d</sup> Applies before mounting and after removal of internal or external snap ring.<sup>e</sup> Does not apply to bearings with flanged outer ring.<sup>f</sup> Applies to groove ball bearings only.<sup>g</sup> Applies only to asymmetrical rings.<sup>h</sup> Applies only to upper deviation limit.

## 6.3 Radial tapered roller bearings

### 6.3.1 Tolerance class Normal

See [Tables 14](#) to [16](#).

**Table 14 — Radial tapered roller bearings — Inner ring — Tolerance class Normal**

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in [Table 27](#).<sup>a</sup> No values have been established for stiffness series A.<sup>b</sup> Tolerances for stiffness series B and C are newly introduced in this edition of this document and can be subject to agreement between customer and manufacturer.

Table 15 (continued)

NOTE The deviation limits for the outside diameter  $D_o$  of an outer ring flange are given in Table 27.

<sup>a</sup> No values have been established for stiffness series A.

<sup>b</sup> Tolerances for stiffness series B and C are newly introduced in this edition of this document and can be subject to agreement between customer and manufacturer.

<sup>a</sup> Applies only to upper deviation limit of asymmetrical rings.

**6.3.2 Tolerance class 6X**See [Table 17](#).

The diameter tolerances,  $t_{Kia}$  and  $t_{Kea}$  for inner and outer rings of this tolerance class are the same as those given in [Tables 14](#) and [15](#) for the tolerance class Normal.

**Table 17 — Radial tapered roller bearings — Width of inner rings, outer rings, single-row bearings and single-row subunits — Tolerance class 6X**

NOTE The deviation limits for the outside diameter,  $D_1$ , of an outer ring flange are given in Table 27.<sup>a</sup> No values have been established for stiffness series A.<sup>b</sup> Tolerances for stiffness series B and C are newly introduced in this edition of this document and can be subject to agreement between customer and manufacturer.<sup>c</sup> Does not apply to bearings with flanged outer ring.**Table 20 — Radial tapered roller bearings — Width of inner rings, outer rings, single-row bearings and single-row subunits — Tolerance class 5**

<sup>a</sup> These deviation limits apply to stiffness series A and B.

<sup>b</sup> These deviation limits apply to stiffness series C and S.

<sup>c</sup> No values have been established for stiffness series A.

<sup>d</sup> Tolerances for stiffness series B and C are newly introduced in this edition of this document and can be subject to agreement between customer and manufacturer.

## 6.5 Basically tapered bores, tapers 1:12 and 1:30

Tolerances for tapered bores for tolerance class Normal are given in [Tables 28](#) and [29](#).

The tolerances for a tapered bore comprise

- $t_{\Delta dmp}$ ;
- a taper tolerance, given by deviation limits for tapered slope,  $t_{\Delta SL}$ ;
- $t_{Vdsp}$ .

NOTE See [Figure 7](#).
