Test Method for Server Performance, UL 2640

First Edition, Dated July 8, 2011

Summary of Topics

This is the First Edition of the Test Method for Server Performance

All rights reserved. No part of this publication may be reproduced, stored in a retrieval system, or transmitted in any form by any means, electronic, mechanical photocopying, recording, or otherwise without prior permission of UL.

UL provides this Test Method "as is" without warranty of any kind, either expressed or implied, including but not limited to, the implied warranties of merchantability or fitness for any purpose.

In no event will UL be liable for any special, incidental, consequential, indirect or similar damages, including loss of profits, lost savings, loss of data, or any other damages arising out of the use of or the inability to use this Test Method, even if UL or an authorized UL representative has been advised of the possibility of such damage. In no event shall UL's liability for any damage ever exceed the price paid for this Test Method, regardless of the form of the claim.

Users of the electronic versions of UL's Test Methods agree to defend, indemnify, and hold UL harmless from and against any loss, expense, liability, damage, claim, or judgment (including reasonable attorney's fees) resulting from any error or deviation introduced while purchaser is storing an electronic Test Method on the purchaser's computer system.

INTRODUCTION

1 Scope

1.1 These performance ratings apply to desktop servers, rack-mountable servers, individual blade servers, chassis containing multiple blade servers, and supercomputers intended to be supplied by a branch circuit of 600 volts ac or less.

1.2 The servers covered by this Test Method shall be provided with at least one CPU and at least one hard disk drive or solid state drive, support an operating system, and be capable of being booted from a memory stick.

1.3 These requirements are intended to be a hardware performance efficiency metric and not an application performance metric.

1.4 These requirements do not cover servers that are provided with a means for direct connection to a DC power supply.

1.5 For this Test Method, server performance is evaluated using standardized server performance software.

2 Units of Measurement

2.1 Values stated without parentheses are the requirement. Values in parentheses are explanatory or approximate information.

3 Undated References

3.1 Any undated reference to a code or standard appearing in the requirements of this Test Method shall be interpreted as referring to the latest edition of that code or standard.

4 Glossary

4.1 For the purpose of this Test Method, the following definitions apply.

4.2 SERVER – A computer that provides services and manages networked resources for client devices.

4.3 CHASSIS – Enclosure that contains multiple servers or individual blades.

4.4 SUPERCOMPUTERS – Chassis or multiple chassis containing several servers which are connected to act as one. May be powered from one common dc supply or powered from individual ac supplies.

4.5 IDLE MODE – An operational state in which the operating system and other software have completed loading and the server is capable of completing workload transactions, but no active workload transactions are requested or pending by the system.

4.6 OFF MODE – The lowest power consumption mode which cannot be switched off (influenced) by the user and that may persist for an indefinite time when a server is connected to the main electricity supply.
